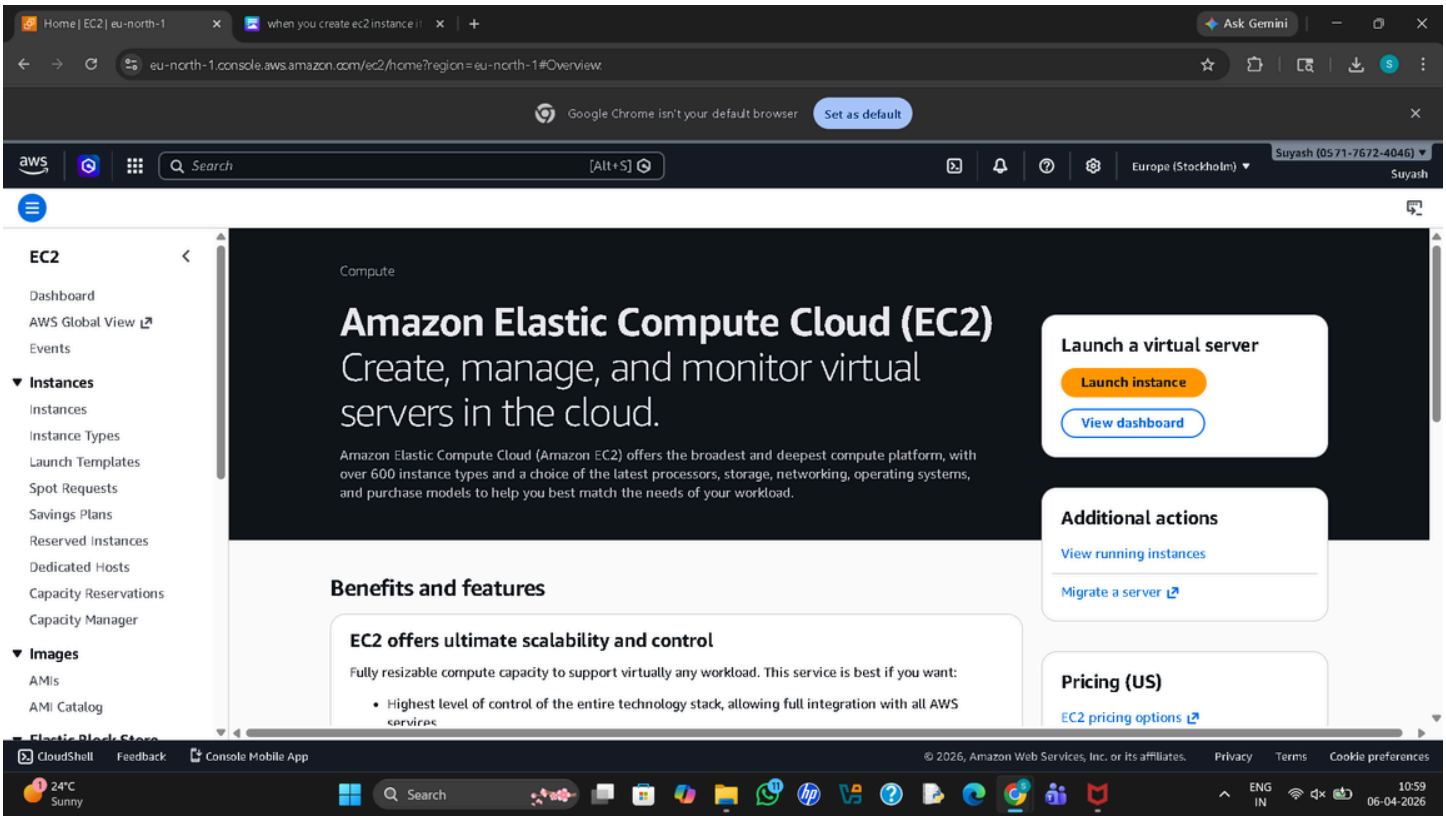
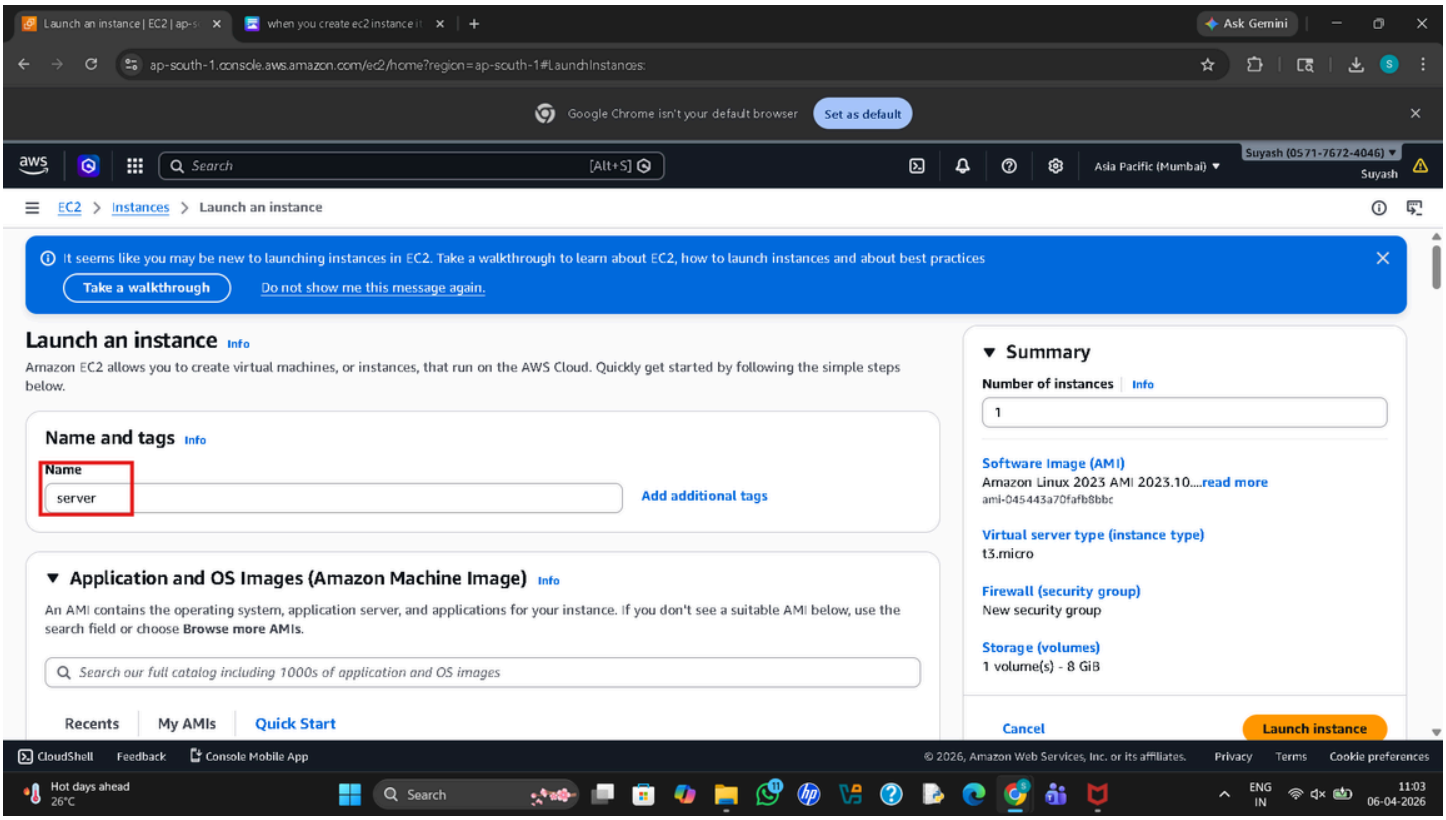
# when you create ec2 instance it  need to create volumes automatically and when u delete it won't be deleted

Go  to AWS console and sign it

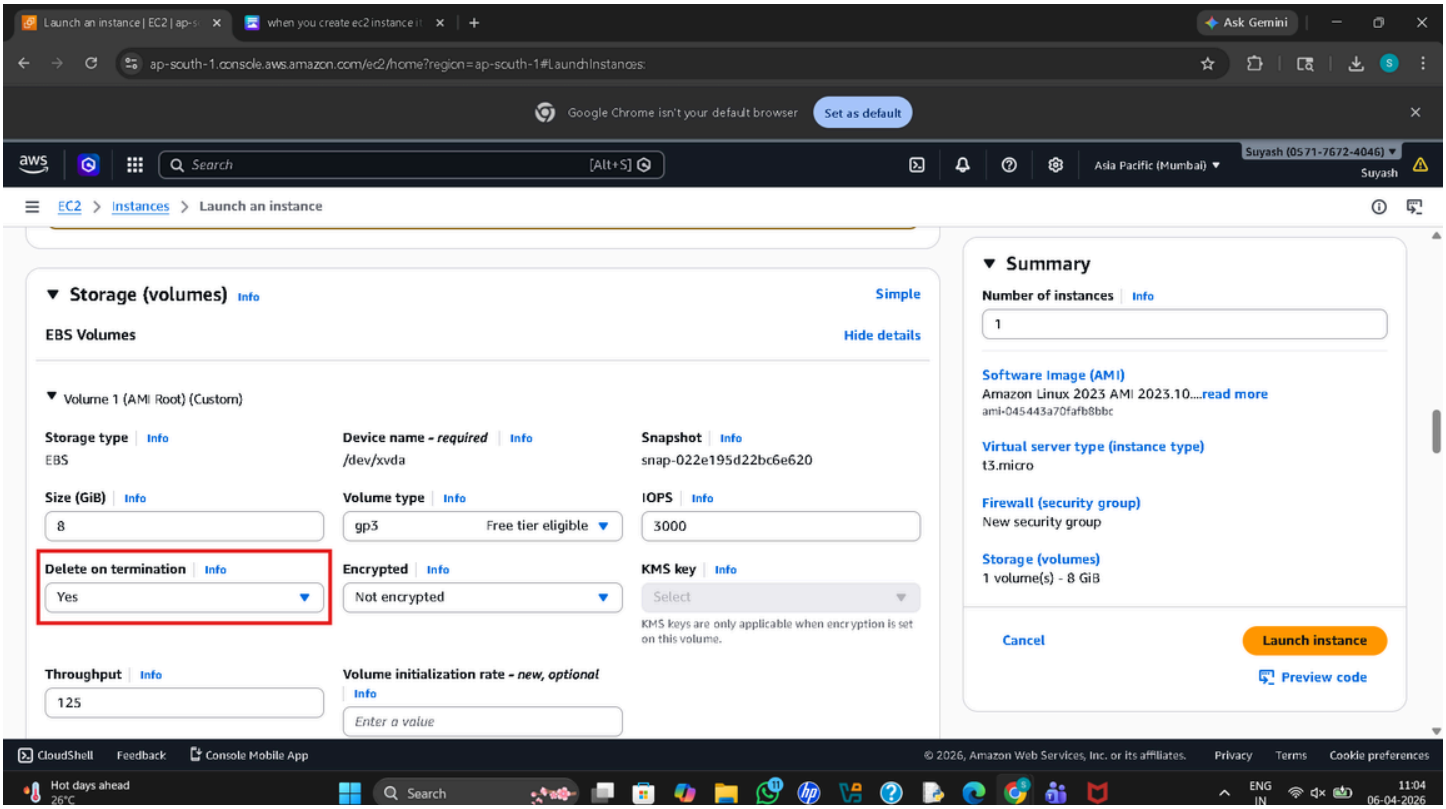
Go to EC2 instance



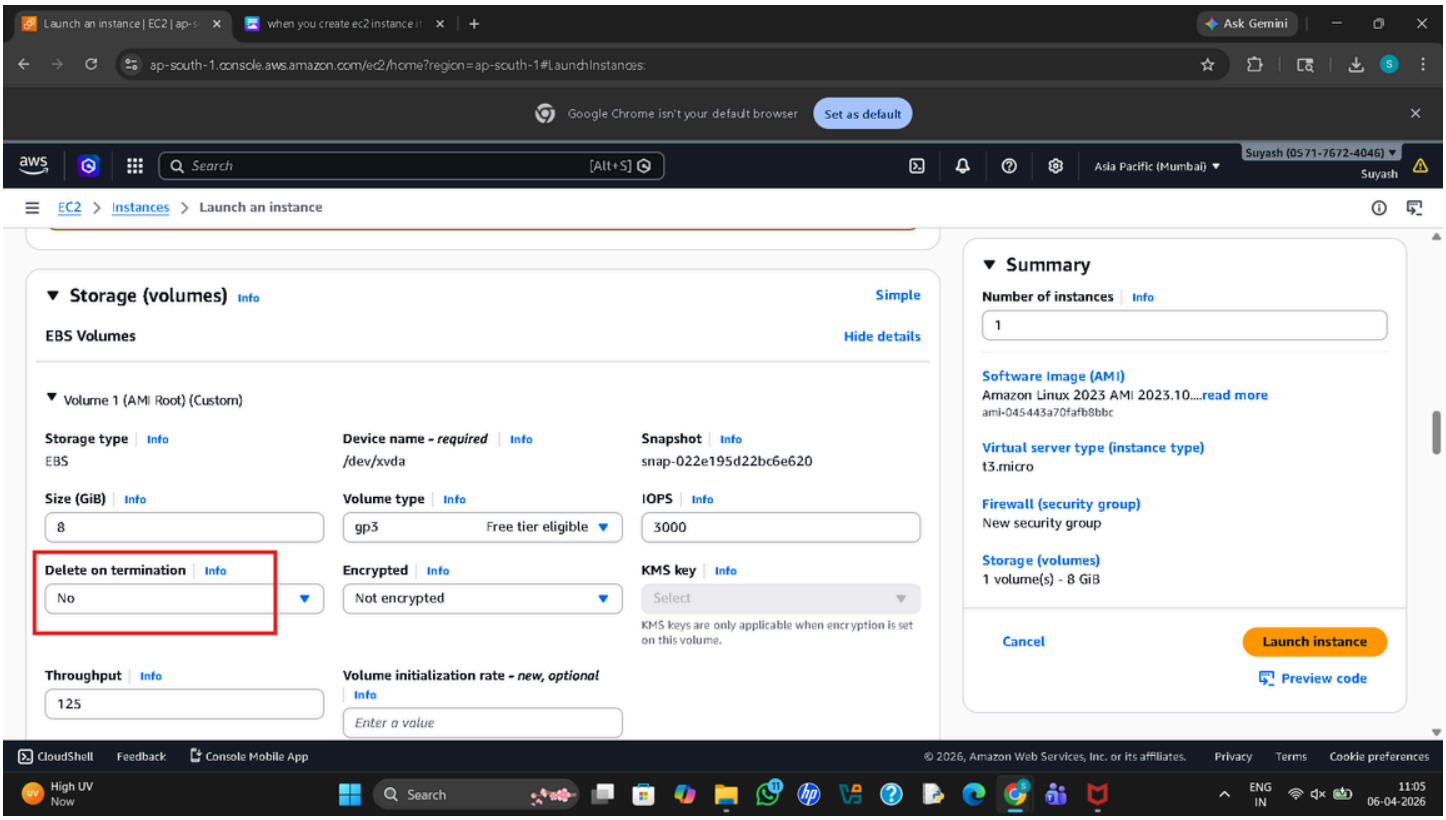
And create new ec2 instance



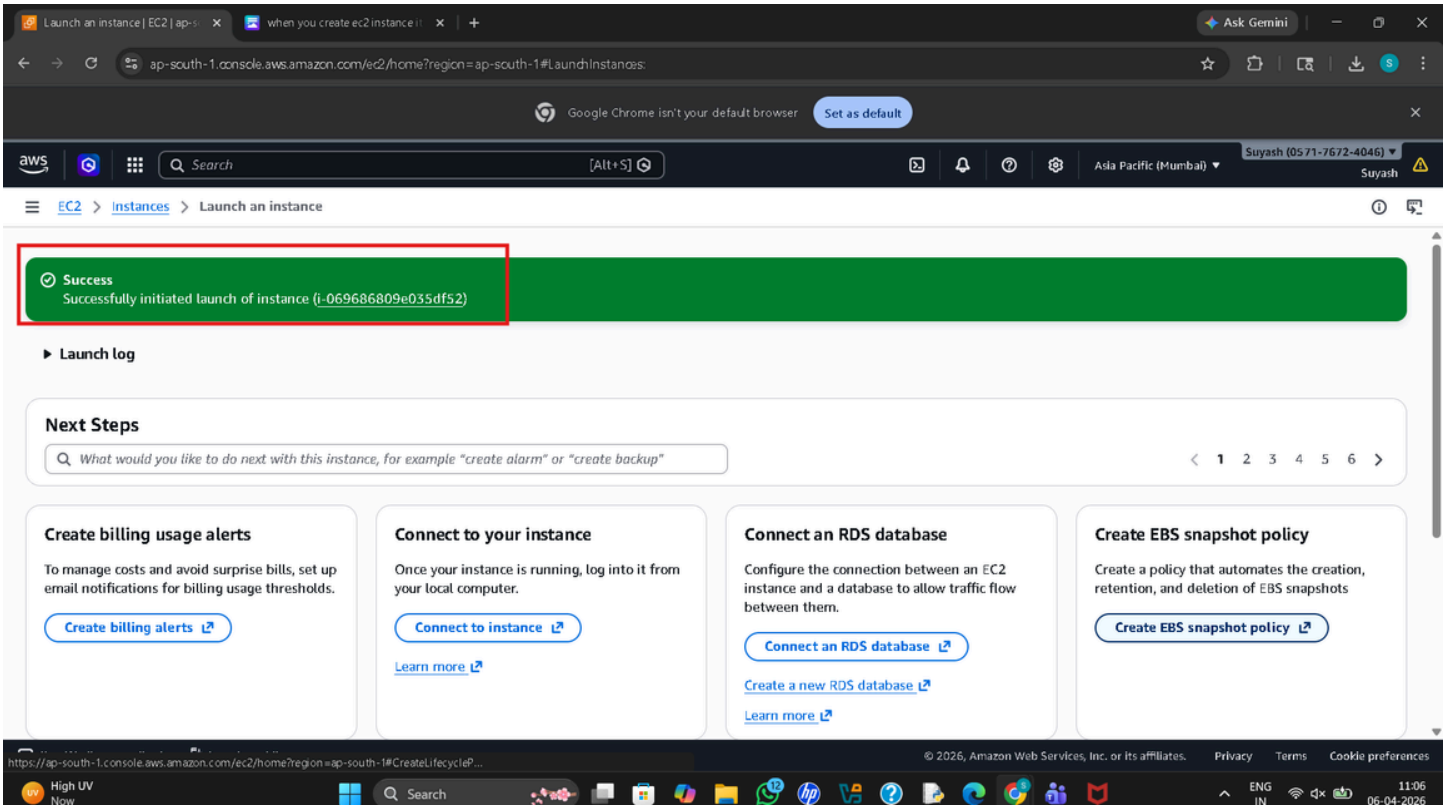
Go on storage volumes setting

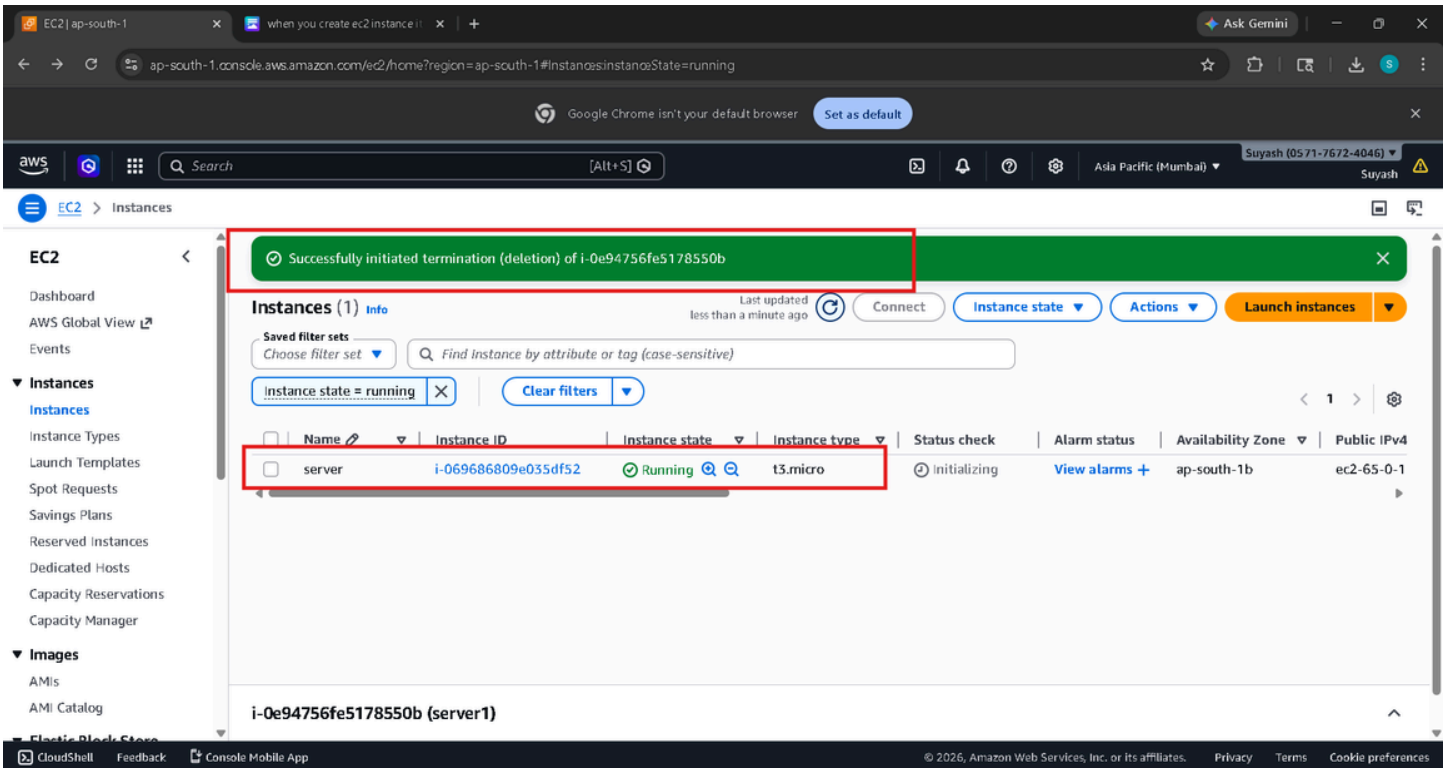


Select Delete on termination NO

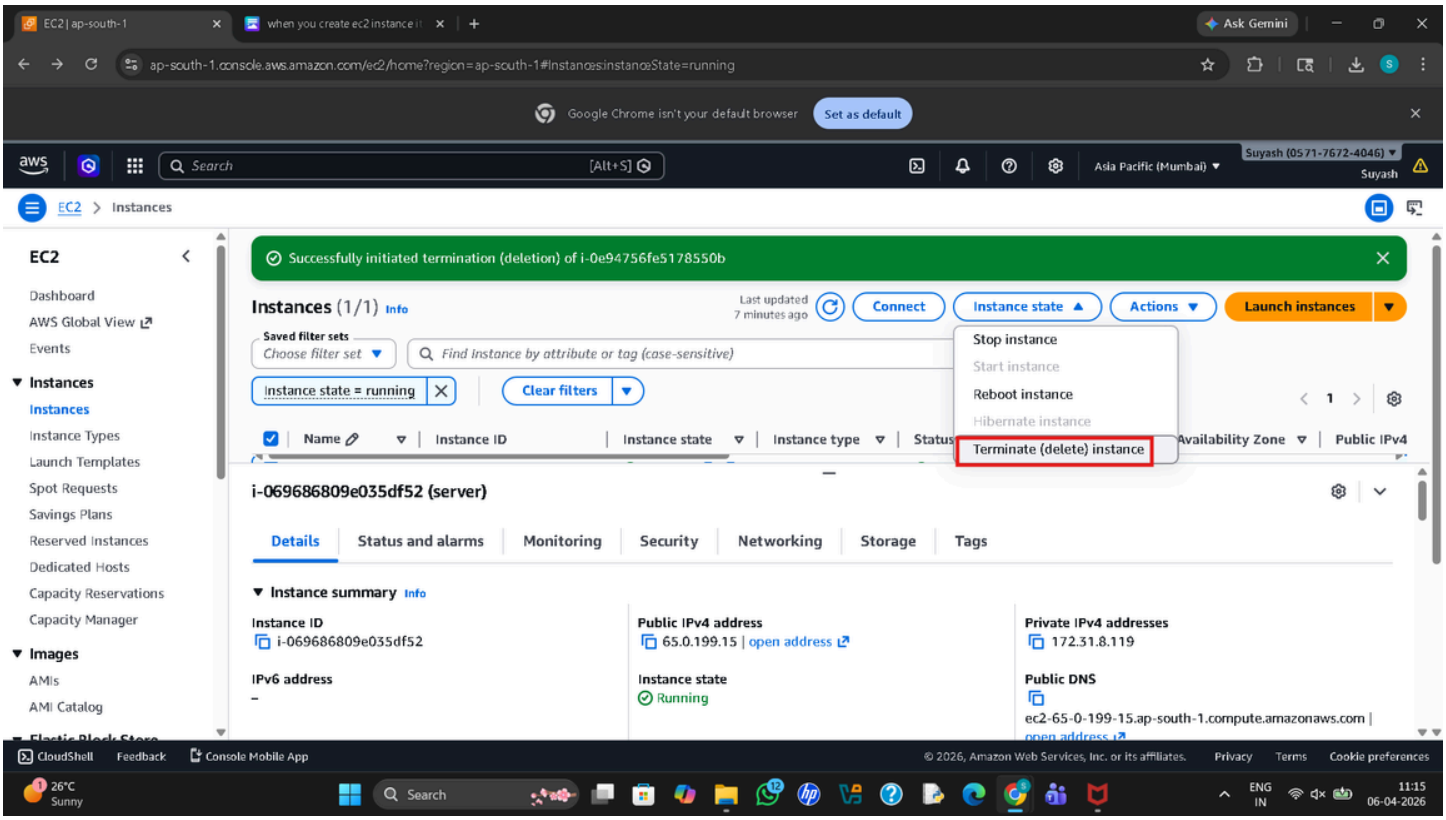


Launch instance Successfully

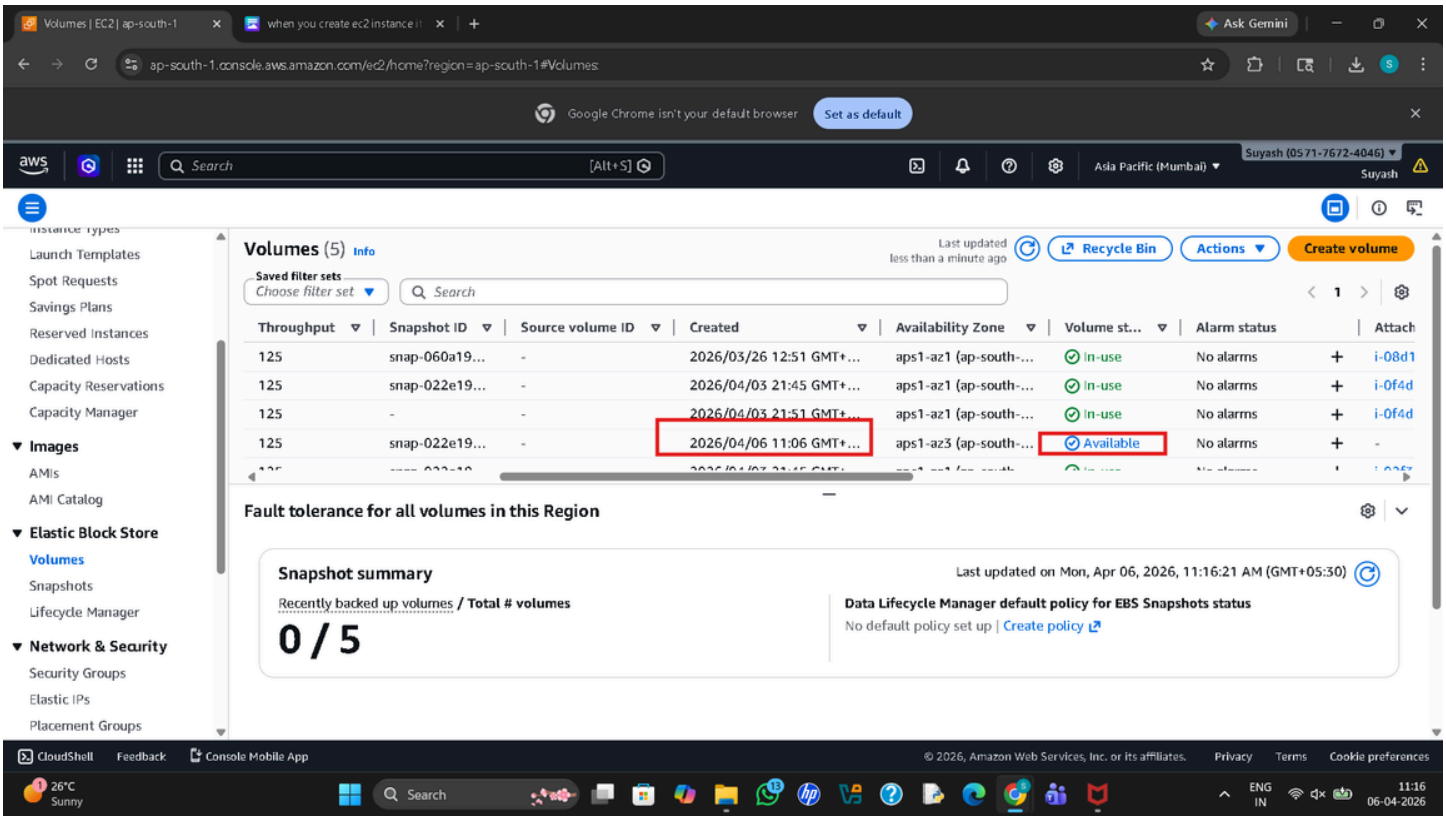




Terminate it



you see your volune not be deleted it is available to attach different server.



When you launch an AWS EC2 instance, a default **EBS (Elastic Block Store) volume** is automatically created and attached as the root volume. By default, this volume is configured with **“Delete on Termination = True”**, meaning it gets deleted when the EC2 instance is terminated.

In this project, we modify this behavior to ensure that the EBS volume is **not deleted** when the instance is terminated. This allows data persistence even after the EC2 instance is removed.

## Key Concepts Covered:

- Automatic creation of root EBS volume during EC2 launch
- Understanding **Delete on Termination** setting
- Modifying EBS volume behavior
- Retaining storage after EC2 termination
- Reattaching existing volume to a new EC2 instance
